Vision Board Self Reflection   Bethany
Davis

I have always found myself to be a person who is incredibly flexible and does not think much about what may happen in the future. This was also ensured during this project. Beginning, I had several ideas on how to create an interesting project that displays my ideas, but many of them had to be changed as I proceeded into the production of the final product. Such as having netting over the board to appear as a window screen. I had to remove this since it made the details of my collage impossible to make out. As well, I can say I struggled quite a bit during this project because I have no concrete aspirations for life. Therefore I did try and focus on more of the overarching, and slightly vague, ideals. For example, I picked quite a few quotes such as ¨Beautiful proof that you have been there and done that¨.
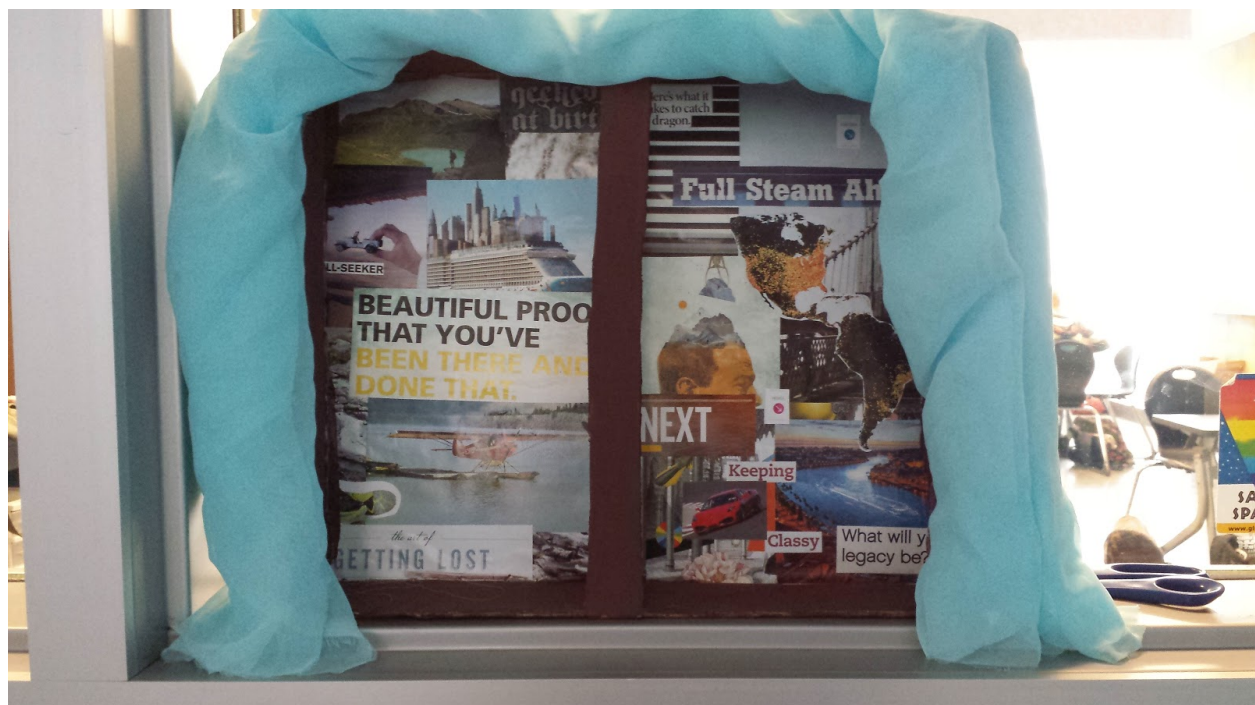

A strength I have, and have developed through many projects, is my ability to be resourceful. I encountered a lot of roadblocks such as a lack of materials, wrong materials, and ideas that I could not implement effectively. I found that I was easily able to think around the problem and continue have productive work time. Such as using a curtain instead of a window screen. A skill that I was pushed in was the way I approach a project. As this one required me to be more detailed off the bat, I had to spend more time than I usually did designing what I wished to make. This is something I do find incredibly important in engineering and other areas so I was glad that I had the opportunity to explore that more.

I think that I put a lot more effort into the designing stage than I did the creation of the final product. There were a lot of ideas I had in the design of the project that I did not later implement. Although there were problems that arose that prohibited certain elements being added, I still feel as though I could have put more effort into the final product so that it could have been closer to my original idea. As the following image shows, I planned to having both my recreational hopes and more career oriented hopes on opposite sides. As well, I wished to have all the smaller images make up a larger one. I did have two sides showing those different aspects, but I did not manage to make all the pictures make up one larger one. I do like it somewhat better the way it is because the pictures I added were ones that I really like and thought highlighted what they needed to.

Project Sketch:

Final Product:

I found that I did effectively integrate a 3d element into my design. Although I did have to make changes, I managed to add other materials I did not expect to. Namely the curtain. I originally wanted to make a full on window and possibly have an interactive element with that, but since that would have made my images unclear I changed it. I do think that the thought that went into the element was there. I have always been on the move which means looking out of windows. Whether they be from airplanes or cars. I wanted to highlight that in my piece and how I will continue to do so. I think that the execution could have been smoother, but otherwise I am proud of how it turned out.
